

See Up Close...Far Away...and In-Between

You turned 40...and you're struggling to see your phone and the restaurant menu...

You probably have **presbyopia: an age-related eye condition that affects everyone over the age of 40**, even those who never needed vision correction before.

Presbyopia is caused by a loss of elasticity within the natural lens of the eye that makes it more difficult for the eye to focus up close. This ultimately results in *blurred near vision*, and perhaps these other typical Presbyopic Problems:

- “Long Arm Syndrome” – you just can’t hold your phone far enough away to be able to read it!
- Reaching for Readers more often than you would like!

Finding a vision correction solution for these presbyopic problems can be even more challenging if you have astigmatism.

Fortunately, there is a great solution in Duette Progressive!

Transform your vision with Duette Progressive

With Duette Progressive you can call or text effortlessly. Enjoy a good read. And bring the distance into focus. All at the same time!

Duette Progressive is an advanced technology contact lens, designed for people who are looking for ways to see their best, *even if they have astigmatism!*

The center of the lens is made of a rigid material to give you great, stable vision. The soft skirt keeps the lenses comfortable throughout the day.

No other contact lens uses the dual material design to provide clear vision and comfort in a single lens.

Plus, Duette Progressive lenses are personalized for your eyes to give you the great vision you deserve.
